LONG ISLAND, N.Y., and KANSAS CITY, Kan. -- ERUCES, Inc., a provider of innovative security software that completely prohibits unauthorized users from reading or tampering with protected data, today announced that bigVAULT Storage Technologies Inc., one of the leading providers of online storage solutions, has joined the "Protected by Tricryption" program to protect customer data using the ERUCES Tricryption® Engine.

### Storage Closet

The ERUCES Tricryption Engine is a patent-pending database encryption system that uses industry-standard algorithms and integrates with the customers' preferred middleware. The Tricryption Engine employs a unique "triple encryption" process that prevents unauthorized access to confidential information stored in the database. The Tricryption Engine provides the highest level of data security possible today by using hidden link dynamic key management.

bigVAULT's storage architecture was designed with scalability, reliability, flexibility and security as the corner stones of its framework. Building upon this foundation, bigVAULT has capitalized on its core online storage technology to offer: Online Storage and Backup Services; Enterprise Solutions that can be Hosted or offered as an In-House turnkey solution; and Vertical Applications that specifically require a storage solution.

"Many service providers have had trouble growing their customer bases due to concerns about protecting their data," said Michael Lovitch, director of service provider sales, ERUCES. "By becoming a 'Protected by Tricryption' partner, bigVAULT is providing their customers with the only solution that ensures their stored data is not tampered with and that their data remains unchanged and intact."
